Headwater Stream Initiative

- Robert D. Davic
- Steve Tuckerman
- Paul Anderson
- Mike Bolton

Why are headwater streams important?

- The most prevalent form of stream in the state, with over 115,000 miles estimated to exist (vs. 21,000 miles of named streams).
- Provide habitat for native fauna well adapted to headwater stream conditions.
- Important in the assimilation of pollutants and storage of runoff and flood waters.
- The “capillaries” of the state’s stream network.

Federal Clean Water Act

- The Clean Water Act provides authority for states to issue water quality standards and “designated uses” to all waters of the United States upstream to the highest reaches of the tributary streams.

Ohio EPA

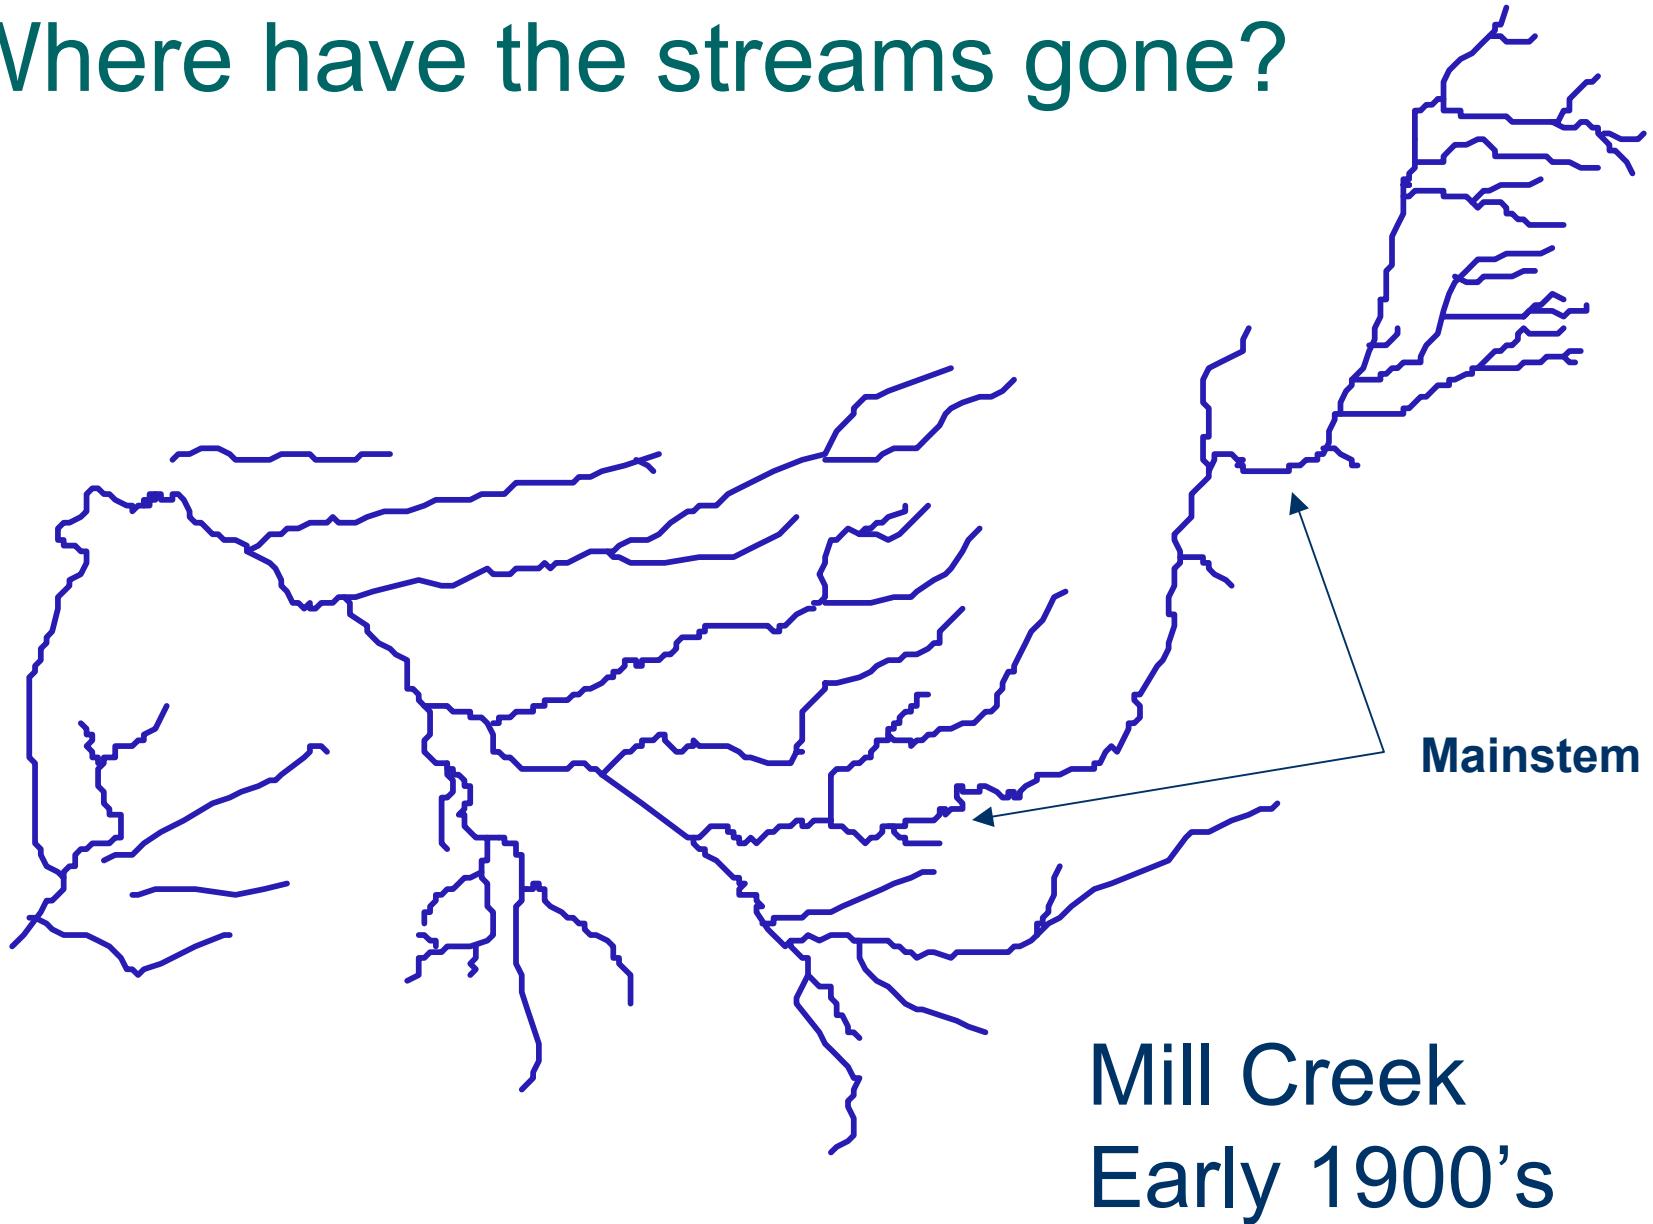

Headwater Stream Initiative

- Ohio rules require all water bodies to have designated uses.
[OAC 3745-1-01, OAC 3745-1-07 (A)(1)]
- Current stream use designations are inadequate to classify small headwater streams.
- Since 1999 research has been conducted to determine appropriate methods for classifying headwater streams.
- Data will be used to propose new aquatic life use designations for “primary headwater habitat” streams in Ohio.

Primary Headwater Habitat Streams

- **Primary headwater habitat (PHWH) streams are incapable of meeting established biocriteria for fish because of their small size and lack of deep pools.**
- **Generally $< 1 \text{ mi}^2$ watershed area and pools less than 40 cm in depth.**
- **“Primary Headwater Habitat” term is used to distinguish from “headwater” fish streams in current use designations ($<20 \text{ mi}^2$).**

Primary Headwater Stream (PHWH) Evaluation Methodologies

- An evaluation protocol for PHWH streams was developed in 1999.
- A total of 305 sites were sampled by the Ohio EPA in 1999-2000. Quarterly biological monitoring of reference sites was also conducted.
- Randomized sampling of five geographic areas was conducted in 2000 to estimate the distribution of different types of headwater streams in the state.

Study Design: Field Evaluation

- **Biology:**
 - Fish
 - Macroinvertebrates
 - Amphibians
- **Water Quality:**
 - Field measures
(DO,pH,Temp.,Conductivity)
- **Physical and Habitat Features:**
 - 61 meter (200 ft) zone

Class I PHWH Streams

- Ephemeral Flow. Dry channel present annually.
- Aquatic life absent or present seasonally - low diversity.

Modified channel, Delaware Co.

Natural channel, Wood Co.

Class II PHWH Streams

- Warmwater adapted community.
- Flow may be intermittent.
- Permanent pools present annually.

Modified channel, Delaware Co.

Natural channel, Geauga Co.

Class III PHWH Streams

- **Perennial flow.**
- **Presence of one or more of the following at all times:**
 - **Obligate aquatic salamanders**
 - **Cold water or pioneering fish species**
 - **Cool water adapted benthic macro-invertebrates.**

Results: Benthic Macroinvertebrates

Two distinct macroinvertebrate communities:

Results: Headwater Macroinvertebrate Field Evaluation Index (HMFEI)

- Rapid field assessment methodology based upon Family or Order level of taxonomy.
- Scoring based upon correlation to cool water habitats and number of EPT taxa present.
- HMFEI is a surrogate. Final determination based upon lowest taxonomic level identification.

Reside Dace

Two-lined Salamander

- **Class III PHWH streams** characterized by the presence of cold water adapted species of fish and/or salamander species with 1-2 year gilled larval period.
- **Class II PHWH streams** may have pioneering fish species present. Cold water fish species absent. Salamander adults or larvae of species with short duration gilled larval period may be present.

Salamanders Found in Headwater Streams in Ohio

Class III Streams (Gilled larvae present on annual basis)

- Plethodontidae (Lungless)
- Subfamily Plethodontinae:
 - *Gyrinophilus* (2 species)
 - *Pseudotriton* (2 species)
 - *Eurycea* (4 species)

Class II Streams (Gilled larvae present seasonally)

- Ambystomatidae (Mole)
 - *Ambystoma* spp.
- Plethodontidae (Lungless)
- Subfamily Desmognathinae:
 - *Desmognathus* (2 species)

Distribution of Class III PWHH Indicator Salamander Species

(N=212 Sample Events from 144 Streams)**

Stream Water Temperature

Seasonal Differences in Water Temperature Between Class III and Class II-I Primary Headwater Streams in Ohio

(Excluding Northwest Ohio Modified Streams)

River Continuum Concept

- Salamanders replace fish as the top vertebrate predator in primary headwater streams.
- Shredder functional group of benthic invertebrates is most common in primary headwater streams.

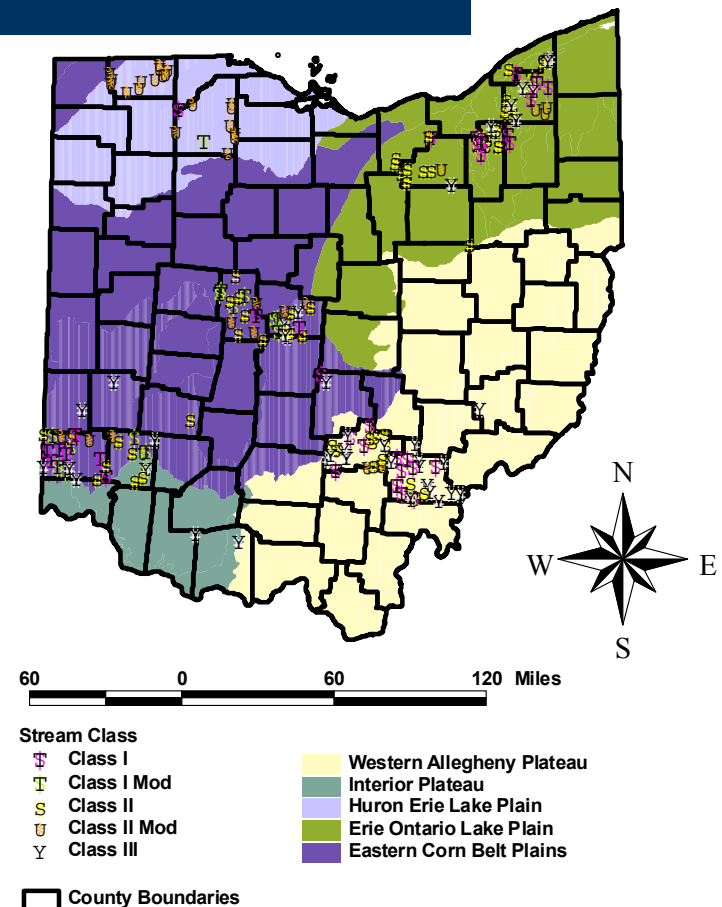

PHWH Stream Assessment Results

- Sampling of randomly chosen sites used to estimate the miles of various stream categories.
- Ratio of PHWH streams to streams delineated on USGS topo maps = 5.5:1

Development of a Headwater Habitat Evaluation Index (HHEI) to Predict PHWH-Stream Classes

- A Headwater Habitat Evaluation Index (HHEI) was developed to provide a rapid assessment tool to predict PHWH stream classes.
- Data from 213 sites state-wide was used to develop the index.
- The approach was similar to that used to develop the QHEI, an index of fish habitat quality in use in Ohio for over 20 years.

The Headwater Habitat Evaluation Index (HHEI): Metrics

Initial Data Set	Qualitative Screening	Discriminant Analysis	Sensitivity Analysis: Final Metrics
Stream Order	Stream Order	Stream Order	
Flow Regime	Flow Regime	Flow Regime	
In-Stream Cover	In-Stream Cover		
Substrate	Substrate	Substrate	Substrate
Development			
Pool Depth	Pool Depth	Pool Depth	Pool Depth
Riffle Depth			
Riparian Width	Riparian Width		
Riparian Land Use	Riparian Land Use		
Gradient	Gradient		
Watershed Area	Watershed Area		
Sinuosity	Sinuosity	Sinuosity	
Bankfull Width	Bankfull Width	Bankfull Width	Bankfull Width
Bank Erosion			
Embeddedness			
Cover Types	Cover Types		
Water Chemistry			

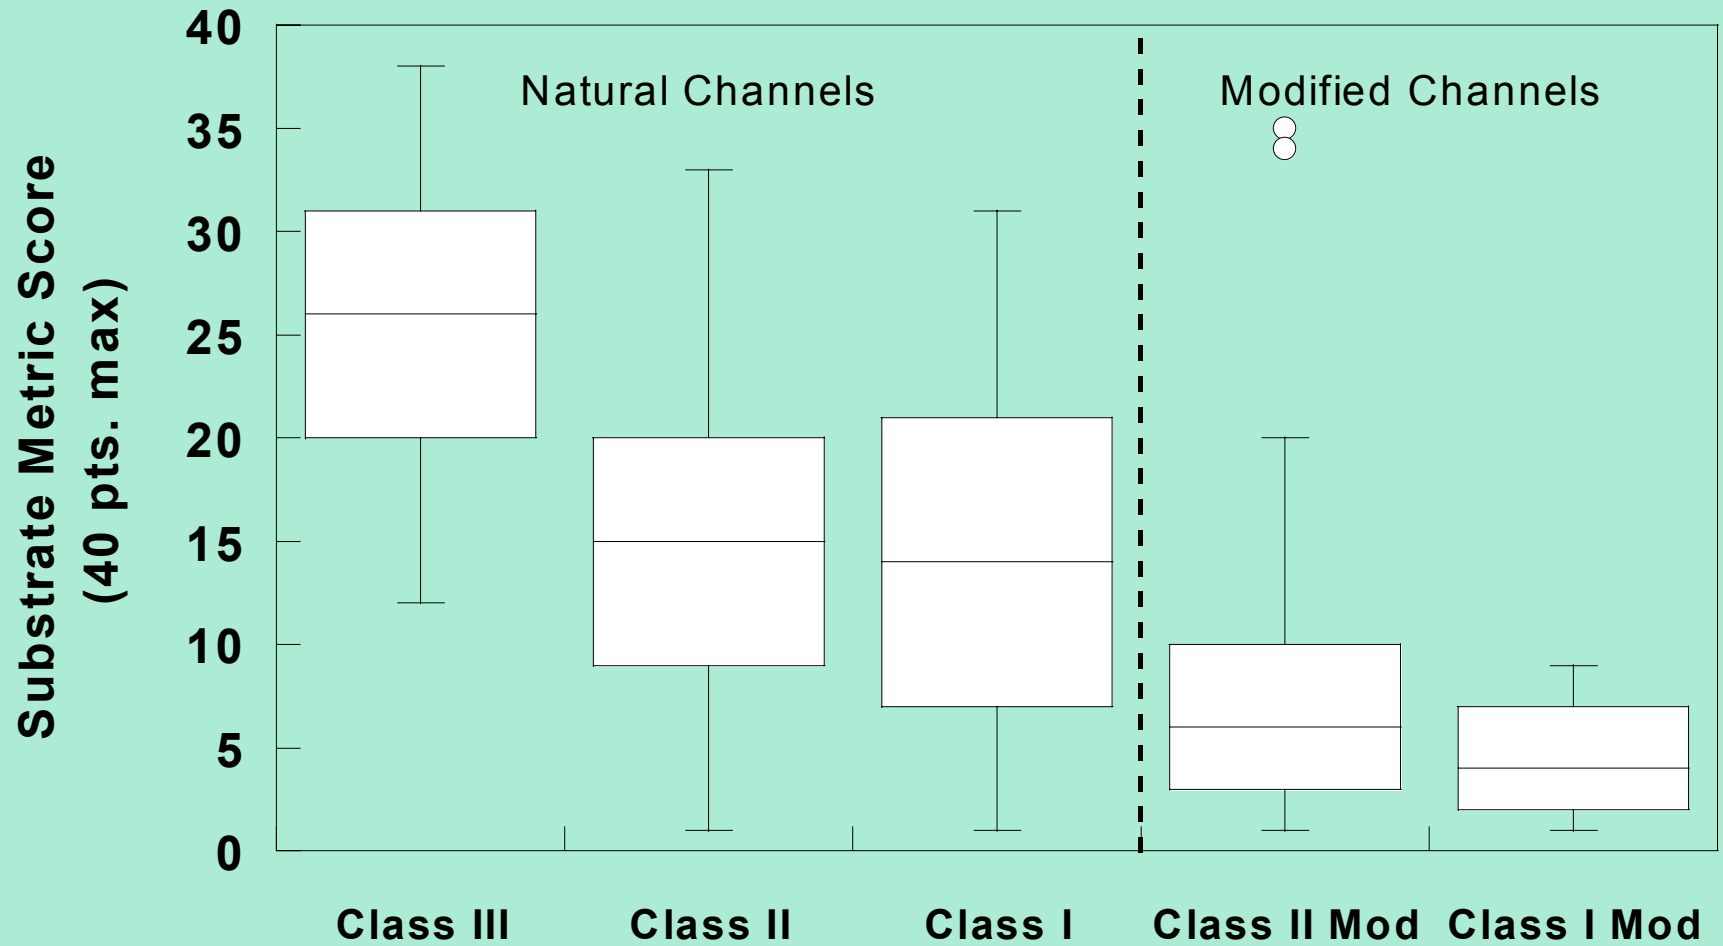

The Headwater Habitat Evaluation Index (HHEI): Metrics

Final HHEI based on three metrics:

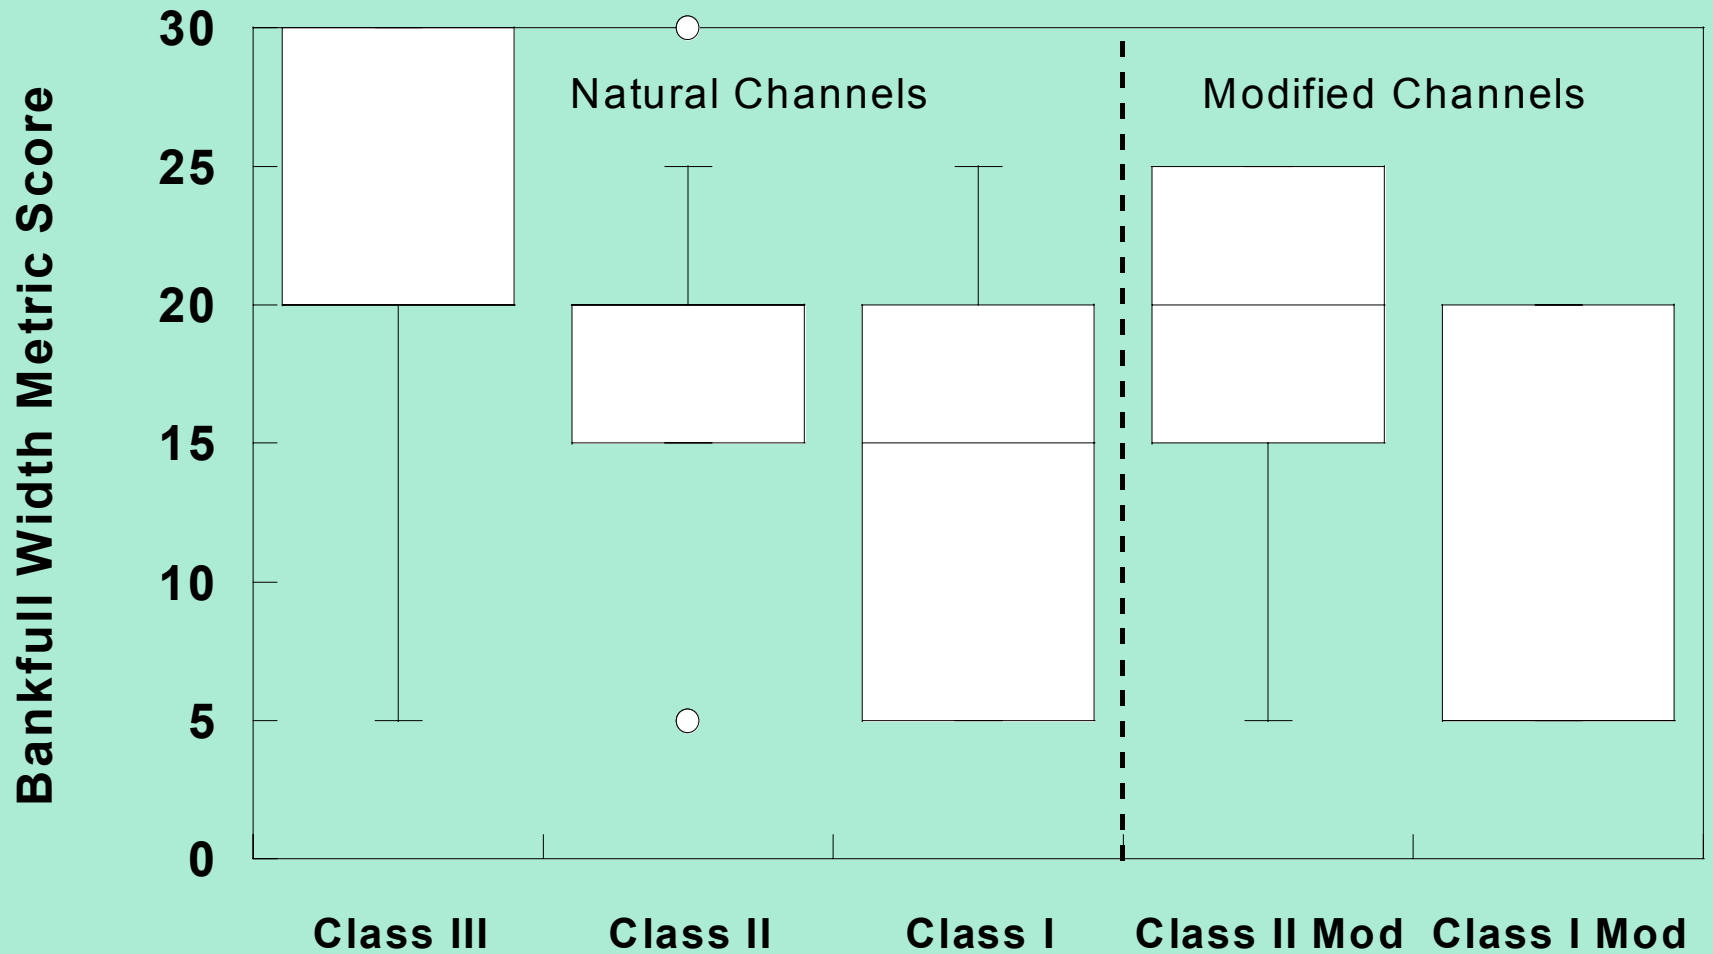

- **Substrate Metric (40 points)**
 - Based upon predominant channel substrate types and the number of substrate types present.
- **Bankfull Width (30 points)**
 - Based upon average bankfull width.
- **Maximum Pool Depth (30 points)**
 - Based upon a single measure of maximum pool depth.

Total HHEI Score ranges from 0 to 100

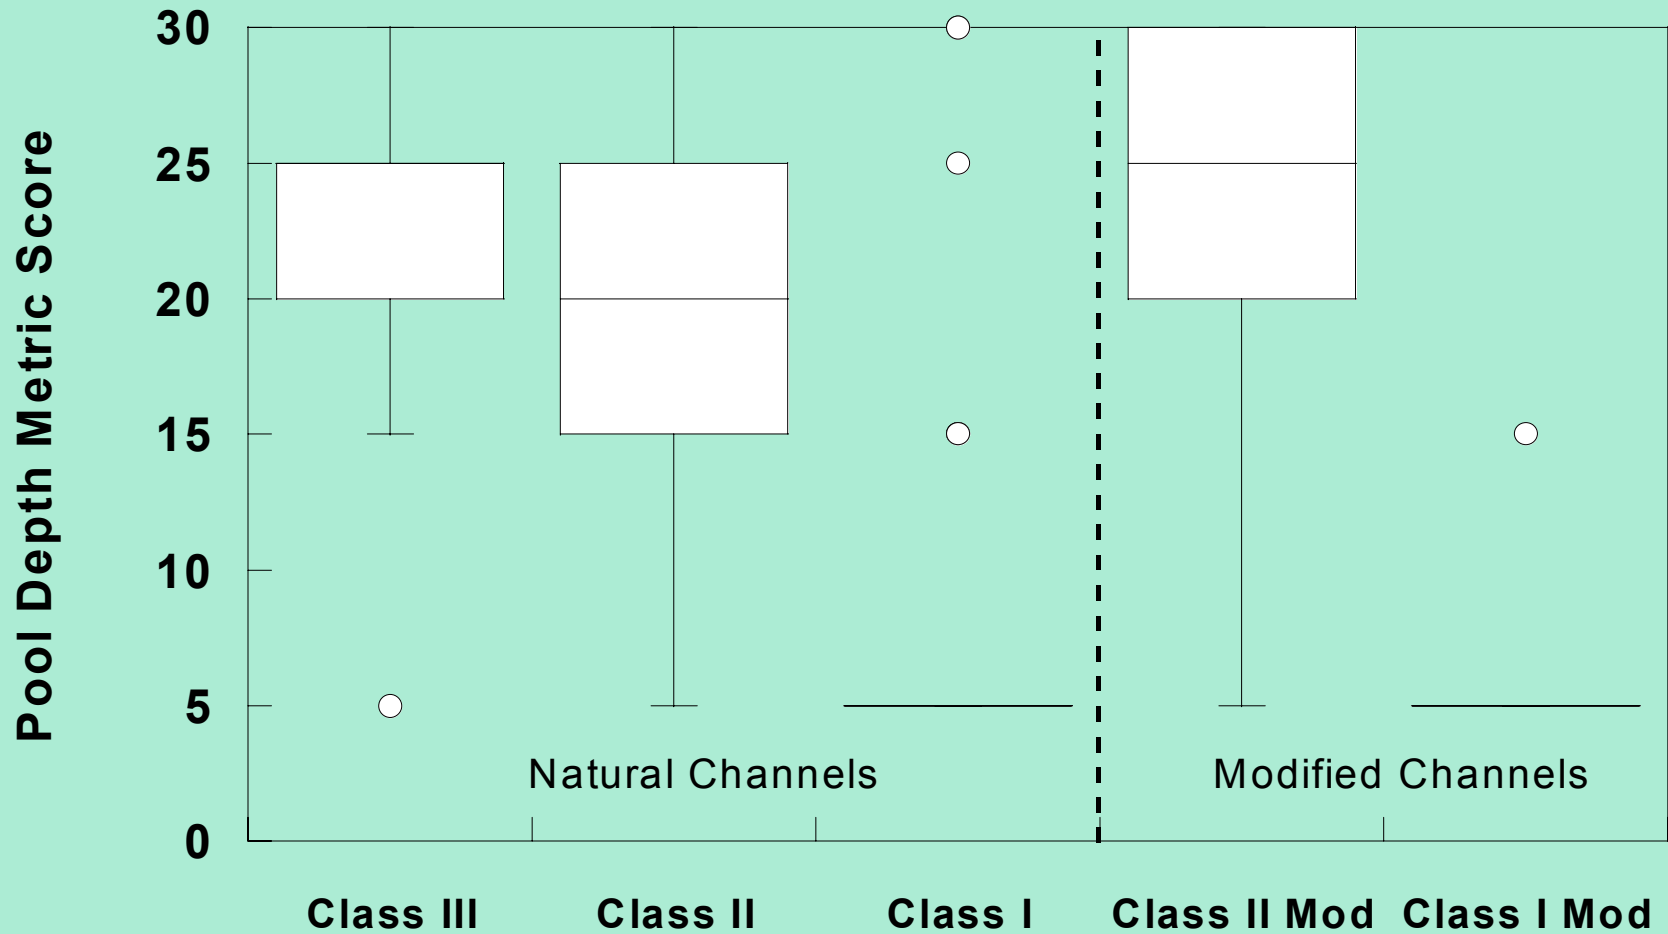

Substrate Metric Scores

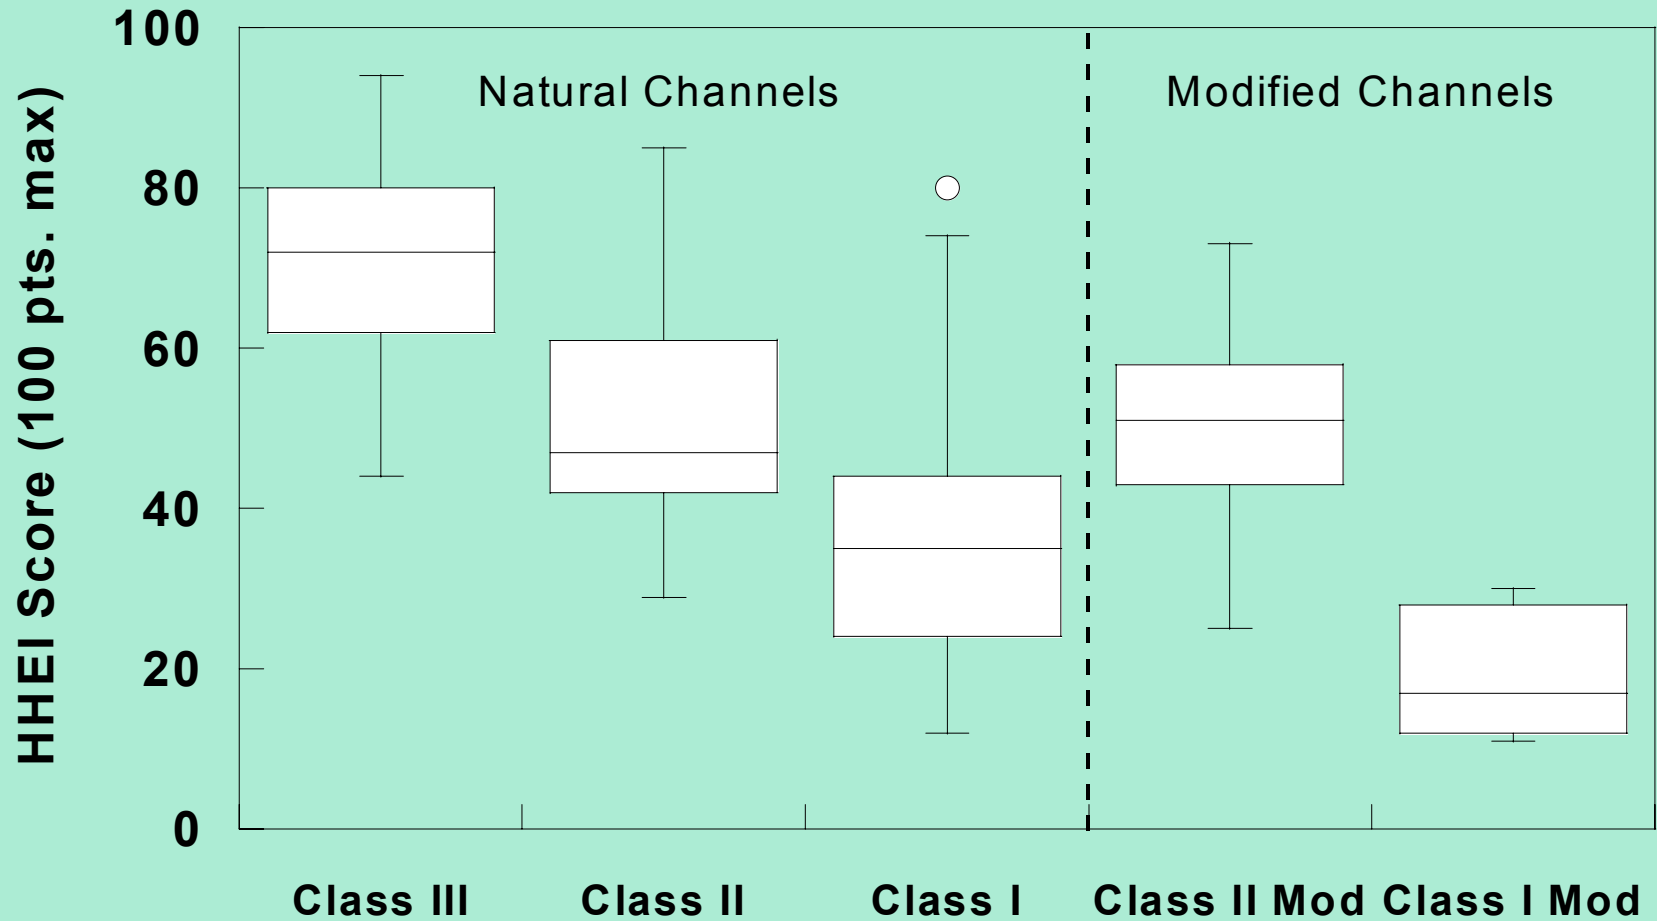

Bankfull Width Metric Scores

Pool Depth Metric Scores

Total HHEI Scores

Use of the HHEI to Predict Headwater Stream Classification

Advantages to HHEI Approach

- Provides rapid assessment which can be conducted in 15-20 minutes.
- Provides immediate insight into stream classification.
- Can be learned with minimal training.
- Does not require rigorous biological evaluation.
- Can be conducted at any time of the year.
- Independent of factors which are not within OEPA's regulatory authority.

Three-Tiered Evaluation Approach

- 1st Tier: HHEI scoring and flow chart (required for all sites)
- 2nd Tier: Rapid bio-assessment using HMFEI (common)
- 3rd Tier: Salamander survey (10 meter zone), fish survey, macroinvertebrates identified to lowest taxonomic level (very rarely needed)
